

Exploring the sea or space must be quite an adventure. It seems to me that we discover a lot of things and details doing it but at the same time it brings complications and expenses. It would be amazing to be able to see some of these places up close. From the ocean we would know new species and bases of our history, while, from space we could know if there is life in other planets or if there are some identical or similar to the earth. Although all this sounds very interesting, we have to recognize that it could be costly and dangerous. Not all research ends well and whether diving or traveling into space, there are many risk factors when performing this activity. This is why it is necessary to evaluate the way in which this exploration is carried out and be aware of the advantages and disadvantages of it.
